

Cherry Precision App — Project Reference Guide

Complete reference for studying the project structure, passwords, features, and configuration

Project File Structure

Your app has **3 main source files** + assets. All code lives in one folder:

```
cherry-precision-app/
├── src/
│   ├── index.html    ← All HTML (structure & layout)      – 1318 lines
│   ├── main.js       ← All JavaScript (logic & CRUD)      – 1070 lines
│   ├── styles.css    ← All CSS (styling & animations)    – 2416 lines
│   └── assets/
│       ├── logo.png  ← Cherry company logo
│       ├── tauri.svg  ← Tauri framework icon
│       └── javascript.svg
├── src-tauri/        ← Rust backend (Tauri config)
├── package.json      ← Node.js project config
└── package-lock.json
```

Everything visible in the app comes from just 3 files: `index.html` , `main.js` , and `styles.css` .

Password Locations (How to Change)

There are **4 passwords** in the app. All are in **one file**: `main.js`

Password	Purpose	File	Line	Current Value
Login User ID	First-launch onboarding	main.js	Line 7	cherry
Login Password	First-launch onboarding	main.js	Line 8	cherry123
Settings Password	Unlocking Settings page	main.js	Line 97	cherry123
Airgauge Password	Unlocking Airgauge Setup	main.js	Line 98	airgauge123

How to change a password:

Open `main.js` and edit the lines shown above. For example:

```
// Line 7-8 (First-launch login)
const VALID_USER = 'cherry';           ← Change 'cherry' to your new username
const VALID_PASS = 'cherry123';        ← Change 'cherry123' to your new password

// Line 97-98 (Settings & Airgauge unlocking)
const SETTINGS_PASSWORD = 'cherry123'; ← Change to your new settings password
const AIRGAUGE_PASSWORD = 'airgauge123'; ← Change to your new airgauge password
```

File 1: index.html — What's Where

This file contains ALL the HTML structure (layout, forms, tables, modals). Total: **1318 lines**

Section	Lines	Description
Login Screen	17–63	First-launch login overlay (User ID + Password)
License Agreement	66–119	EULA text + accept checkbox
Navigation Bar	128–207	Top nav buttons (Home, Live Data, Runchat, Report, Status, Settings)
Home Page	209–280	Dashboard cards
Live Data Page	282–290	Placeholder page
Runchat Page	292–300	Placeholder page
Report Page	302–310	Placeholder page
Status Page	312–320	Placeholder page
Settings Page	322–369	6 settings cards grid
Airgauge Setup	370–471	MAC Address + AirGauge ID form + table
Item Master	473–585	Item Code / Name / Drawing form + table
Component Setup	587–743	Channel radio buttons + configuration form + table
Customer Master	745–860	Customer details form + table
Employee Master	862–974	Operator details form + table
Machine Master	976–1143	Code / Name / Description form + table
Password Modals	1245–1303	Settings & Airgauge password popups

To edit the License Agreement text: Edit `index.html` between lines **79–112**

File 2: main.js — What's Where

This file contains ALL the JavaScript logic (events, CRUD, validation). Total: **1070 lines**

Section	Lines	What it does
First-Launch Onboarding	5–89	Login validation → License accept → localStorage save
Navigation Controller	93–160	Page switching, breadcrumb, active nav button state
Password Constants	97–98	Settings + Airgauge password values
Password Modal Logic	160–250	Modal show/hide, validation, error shake
Clock	~260	Header clock update every second
Helper Functions	~270	<code>escapeHtml()</code> , <code>updateBreadcrumb()</code>
Item Master CRUD	350–468	Add / delete / search / render items
Component Setup CRUD	470–599	Add / delete / render configurations
Customer Master CRUD	601–748	Add / delete / search / render customers
Employee Master CRUD	750–863	Add / delete / search / render operators
Machine Master CRUD	865–968	Add / delete / search / render machines
Airgauge Setup CRUD	970–1070	Add / delete / search / render MAC/AirGauge mappings

Each CRUD section follows this pattern:

1. Data array (e.g., `const imItems = []`)
2. DOM element references
3. `renderTable(filter)` function — displays data with search filtering
4. `updateSelectAll()` function — checkbox sync
5. Add button event listener — reads form, pushes to array, re-renders
6. Delete button event listener — removes checked items

7. Select-all checkbox listener
 8. Search input listener
 9. Initial render call
-

File 3: styles.css — What's Where

This file contains ALL visual styling (colors, layout, animations). Total: **2416 lines**

Section	Lines	What it styles
CSS Variables	1–30	Colors, fonts, spacing, border radius
Reset & Global	32–80	Base styles, body, scrollbars
App Container	80–120	Main layout wrapper
Navigation Bar	120–280	Top nav buttons, active states, hover effects
Dashboard / Home	280–500	Home page cards, status indicators
Settings Grid	500–700	6 settings cards layout
Form Styles	700–900	Input fields, labels, buttons
Table Styles	900–1100	Data tables, rows, checkboxes
Password Modal	1100–1200	Modal overlay, shake animation
Premium Sub-page Styles	1525–1930	Section headers, gradient borders, count badges, search bars, empty states
Onboarding Screens	1939–2416	Login card, animated border, glow halo, dot grid, license scroll, checkbox

To change the brand color: Edit `styles.css` line ~8:

```
--accent: #ef4444; /* Change this to change the brand red color */
```

Key Configuration Locations — Quick Reference

Setting	File	Line
App title	index.html	7
Brand accent color	styles.css	~8
Login username	main.js	7
Login password	main.js	8
Settings password	main.js	97
Airgauge password	main.js	98
License agreement text	index.html	79–112
Logo image	assets/logo.png	(replace file)
App version badge	index.html	~206
localStorage key	main.js	6

How to Run the App

As a desktop app (Tauri):

```
cd /home/shahana-v/Downloads/cursor/cherry-precision-app
npm run tauri dev
```

For quick browser preview:

Open `src/index.html` directly in any browser.

To build an installable package:

```
npm run tauri build
```

Important Notes

- **Data is NOT saved permanently yet** — all data (items, customers, etc.) is stored in JavaScript arrays in memory. When you close the app, data is lost. SQLite integration is needed for persistence.
- **Only the onboarding status is saved** — via `localStorage( 'cherry_onboarded' )`.
- **To reset the first-launch login**, clear the browser/app localStorage or delete the app data.
